                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAW19989 represents a protein that has interleukin-1 receptor (IL-1-R) intracellular ligand activity. IL-1-R intracellular ligand proteins are used to screen for agents (e.g. antibodies) that are capable of inhibiting or blocking the binding of an IL-1-R intracellular ligand to the intracellular domain of IL-1-R, i.e. inhibitors of IL-1 activity. Such agents can be used to treat inflammatory conditions.
                                                                                                                                                                                                                                   Novel compositions comprising tetracycline or tetracycline-like compounds for the treatment and/or prevention of acute inflammaresponses and diseases, e.g. septic shock and immune complex-inc

                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC 23 genes, based on the tissues in which they are most highly expressed, CC and include developing products for the diagnosis or treatment of CC proliferative disorders, cancer, tumours, foetal and developmental CC abnormalities, haematopoletic disorders, diseases of the immune system, CC AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, CC allergies, neurological disorders (e.g., Alzheimer's disease, CC Parkinson's disease), cognitive disorders, schizophrenia, asthma, CC skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, CC gastrointestinal disorders, pregnancy related disorders, endocrine CC disorders, and infections. The proteins can also be used to aid wound CC healing and epithelial cell proliferation, to prevent skin aging due to CC sunburn, to maintain organs before transplantation, for supporting cell CC culture of primary tissues, to regenerate tissues, to identify their CC cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties.

CC Antibodies specific for a protein of the invention can be used in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked CC immunosorbent assay (ELISA). The present sequence represents a human content of the invention of the presents and human contents of the invention.

The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosting disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzheimer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lysses, isomerases or ligases. The sequences of the invention are useful in the citagenesis, treatment, prevention and/or prognosis of a wide range of citagenesis, treatment, prevention and/or prognosis of a wide range of citagenesis, including hyperproliferative disorders (e.g. cancer).

CC (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), cetabolic disorders (e.g. phenylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), contabolic disorders (e.g. henylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polynucleotides of the invention can also be used in gene therapy.

AND 22915-AAU 23814 represent the novel human enzyme polypeptides of the

                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                               Š
                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                  δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                          melanoma, lung carcinoma and rhabdomyosarcoma cells, foetal brain, foetal heart and human placenta. The invention also provides T cell epitopes (see AAW81031-54) from MG50, including cytotoxic and helper T cell epitopes, antibodies that specifically bind to MG50 or an MG50 T cell epitope, recombinant vectors, and antigen presenting cells. Methods are provided for identifying an MG50 melanoma associated antigen in an individual and for identifying an immune response against an MG50 melanoma associated antigen, as well as methods of stimulating T lymphocytes that are reactive against cancer cells expressing MG50 and for treating an individual having cancer cells that express MG50. The products and methods can be used for the detection, treatment and prevention of NG50-expressing cancers, e.g. melanomas, lung cancer or
                                                                                                                                                                                                                                                                                                                                               Matches

Human p53 target molecule, 21-JUN-2000 (first entry)

PRG2 protein.

120 1380 60

XXXX

```
The present sequence is the protein encoded by PRG2 gene, that is C upregulated in response to induction of p53 activity in human colon CC cancer EBI cells. This sequence is the human homologue (hPxn) of CC cancer EBI cells. This sequence is the human homologue (hPxn) of CC prosophila peroxidasin gene dPxn, that is expressed in heart, placenta, CC spleen, ovary and intestines. PRG2 is involved in p53-mediated growth CC suppression pathways and plays a role in redox regulation. It is a cCC haem-peroxidase that increases the intracellular content of reactive convergen species (ROS). They are potential targets of p53 regulatory cCC cativity and are useful for modulation of cellular proliferation. PRG2 gene is localised to human chromosome 2p24.3. The PRG target molecules care cytostatic and immunomodulatory activity. PRG polynucleotides, proteins and antibodies are useful as diagnostic and therapeutic agents for detection and treatment of cancer and other proliferative diseases. The gene/cDNA may be used for gene threapy, to restore a gene function comparison of coll cycle arrest and/or as a modal of cancer auseaus as inducers of cell cycle arrest and/or as a modal of cancer auseaus be used to generate 'knockout' animals of the process can be used to generate 'knockout' animals.

                                                                                                                                                                                                                                                                     The present invention relates to methods and compositions for CC detecting an angiogenesis-associated transcript in a cell in a patient. The method involves contacting a biological sample from CC the patient with a polynucleotide that selectively hybridises to a sequence at least 80% identical to any of the angiogenesis-associated chuman polynucleotide sequences given in the specification. These CC angiogenesis-associated polynucleotide sequences comprise genes that CC exhibit changes in expression levels as a function of time in tissue undergoing angiogenesis. The method and the polynucleotide sequences of the invention are useful for diagnosing and treating angiogenesis of the invention are useful for diagnosing and treating angiogenesis associated diseases e.g. cancer. The polynucleotide sequences are also useful in the gene therapy of such disorders. The cangiogenesis-associated proteins encoded by the polynucleotide sequences are useful as a vaccine for therapeutic and prophylactic immunisation. ABU03456-ABU03569 represent angiogenesis-associated
                                                                                                     Matches 176;

   Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of identifying compounds which bind to polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell afferentiation activities; stem cell growth factor activity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               proliferation; metastasis; cancer; tumour; haematopoietic disorder; myeloid cell disorder; lymphoid cell disorder; asthma; arthritis; chronic inflammatory condition; proliferative retinopathy; atherosclerosis; coronary heart disease; arterial ischaemia;
                          thrombolytic activities; receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis. Depending on their biological activities, polypeptides and nucleon

Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      disorder e.g. arteriosclerosis, cancers; autoimmune/inflammatory disorder, AIDS, allergies, anaemia, asthma; cardiovascular disease e.g. congestive heart failure, ischaemia heart disease; developmental disorder e.g. renal tubular acidosis, hypothyroidism; neurological disorder e.g. Alzheimer's disease, dementia, Parkinson's disease, epilepsy or stroke. The SECP polynucleotide and polypeptide are further useful for analysing the proteome of a tissue or a cell type. The polynucleotide is useful for creating knockin humanised animals (pigs) or transgenic animals (mice or rats) to model human disease, and for somatic or germline gene therapy, and further for generating hybridisation probes useful in mapping the naturally occurring genomic sequence. This sequence represents a human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated human secreted protein (SECP) polypeptide from 63 fully defined protein sequences given in the specification. The polypeptide is useful for the diagnosing/treating of disease with decreased/overexpression of SECP. Examples of disorders associated with abnormal expression of SECP include a cell proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ding L,

The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                CRIM-1; Chicken; human chromosome 2p21-16.3; ophthalmological; neuroprotective; renal; osteopathic; dental; vulnerary; immunoge antibody; gene therapy; neurodegenerative disease; eye disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (ABB57737-ABB72072). The sequence data for this patent did not form part of the specification, but was obtained in electronic format direct

                                                                                                                                invention or a mimetic which antagonises or mimics an activity of a CRIMI polypeptide may be used in a method for modulating the biological activity of a polypeptide of the bone morphogenic protein (BMP) family. In this way they may be used to prevent or treat an eye disease, especially cataract formation. They may also be used to treat neurodegenerative diseases, renal and kidney disease, bone and tooth abnormalities, wounds and skin damage, e.g. by use of the nucleic acid in gene therapy by using antibodies directed against CRIMI polypeptides. The present sequence represents chicken CRIMI (AKA S52).
                                                                                                                                                                                                                                                        and the encoded peptide (and mouse and chicken orthologues) that comprises a PGECCPLP group, an insulin-like growth factor binding protein (IGFBP)-like domain, cysteine-rich domain, e.g. CRIM1, interacts with and a transmembrane domain. The protein, e.g. CRIM1, interacts with peptides of the transforming growth factor superfamily. A composition comprising an expression construct comprising the nucleic acids of the
                                                                                                                                                                                                                                                                                                                                                                      Claim 11; Fig 1; 169pp; English.

CC polynoclectide encoding a polypeptide in the adipocyte cells, a CC recombinant host cell expressing at least one of the interacting compound in adipocyte cells, a SID (RTM)) polypeptide comprising a modulating compound in acid compensation of the sequences given in the specification (including its fragment or variant), a vector comprising the SID (RTM) polynucleotide comprising any of the 738 mucleotide sequences cc given in the specification (including its fragment or variant), a vector cc comprising the SID (RTM) polynucleotide, a recombinant host cell cc comprising the vector, a protein chip comprising the polypeptides and cc record comprising all or part of the data, listed in the specification. The complex, polypeptides, polynucleotides and compounds are useful for preventing or treating metabolic disorders such as obesity or diabetes. The polypucleotides are useful as probes or primers. The cc complex is particularly useful for identifying selected interacting cd domains (SID (RTM)) for screening drugs that modulate the protein content of the interaction, thus exhibiting the therapeutic effect. The present content content is sequence represents a SID (prey) protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                             by selecting a bait protein from a known adipocyte marker and then performing a yeast 2-hybrid selection to isolate prey proteins encoded members of an adipocyte cDNA library. The proteins are designated SID (RTM) (selected interacting domains) proteins. Also included are a polynocytide enroding a polynomerida in the adipocyte cDNA library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; prey; adipocyte; SID; selected interacting domain;

useful in transplantation and treatment of conditions exhibiting a
clacrease in neuronal survival and repair. The proteins may also be
useful for the treatment of conditions related to other types of
tissue, such as nerve, epidermis, muscle, and other organs such as
liver, brain, lung, cardiac, pancreas, and kidney tissue. The
proteins may further be useful for the treatment of relatively
undifferentiated cell populations, such as embryonic cells, or stem
cells, to enhance growth and/or differentiation of the cells.
The proteins may also have other useful properties characteristic of
the TGF beta superfamily of proteins. Such properties include
angiogenic, chemotactic, and/or chemoattractant properties, and
effects on cells including induction or inhibition of collagen
synthesis, fibrosis, differentiation responses, cell proliferative
responses, and responses involving cell adhesion, migration, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The human chordin related protein and polynucleotides encoding them are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions which involve defects in cartilage, bone or connective tissue formation and damage to cartilage, bone or connective tissue, e.g. broken bones, congenital, trauma-induced, or oncologic-resection-induced craniofacial defects, periodontal disease, defects in the periodontal ligament or attachment apparatus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 osteoporosis, burns, incisions or ulcers. The proteins may affect neuronal, astrocytic, and glial cell survival and the

                    The present invention describes new human secreted proteins which were isolated from adult placenta, adult retina, foetal brain, foetal kidney, adult blood, adult brain, adult thyroid, adult bloader, adult nural tissue, adult testes, and adult lymph node cDNA libraries. The human secreted proteins, and the polynucleotides encoding them, are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities include nutritional activity, cytokine and activity and activities include nutritional activity.
